

## Smoking Prevalence in Adults\*

Now lets try and do this. We could maybe use this for RBCO. RSweave docs in RStudio are like RMarkdown but just for latex and pdf creation. It has full latex support and nice to work with. We can put plots in with no problem and build the layout around that. I'm writing something here to test several features.

\* Persons aged over 16

Notes:

1. All the typesetting stuff, everything from page number positioning to footnotes can be done in latex and the workflow for using it in an RSweave doc (the way RStudio does this) is really nice
2. Is very easy to make tiny typesetting changes - Latex was designed for producing camera ready papers.
3. This is a nice workflow for doing any academic stuff, so nice to push it into RBCO publishing
